

SOC COPILOT MCP

AI-Native Security Investigation Assistant

\$214B

Global Cybersecurity Market

\$28B

Threat Intel Segment

3.4M

SOC Analyst Shortage

2 hrs

Avg. Manual IOC Investigation

WHAT PROBLEM DOES IT SOLVE?

Security Operations Center (SOC) analysts spend 2–4 hours per incident manually correlating threat data across VirusTotal, Shodan, AbuseIPDB, MITRE ATT&CK, and NVD. This is repetitive, error-prone, and expensive — at \$80–120K/analyst/year. SOC Copilot reduces a full IOC investigation to a single natural-language prompt, delivering correlated verdicts, MITRE technique mappings, YARA rules, and a management-ready IR report in seconds.

TARGET MARKET

- Enterprise SOC teams (Fortune 500, financial, healthcare, government)
- Managed Security Service Providers (MSSPs) — highest value, serve many clients
- Threat intelligence analysts and incident responders
- Red teams and penetration testers (CVE exploitability, domain hunting)
- SMBs with limited security staff who need enterprise-grade intelligence

WHY MCP IS THE RIGHT ARCHITECTURE

MCP is purpose-built for this use case. It gives LLM structured, typed access to external APIs without prompt-injection risk. Tool definitions enforce input validation (correct IP format, valid hash length). The agentic loop lets LLM autonomously chain tools — e.g., run `correlate_ioc`, then `generate_yara_rule`, then `draft_ir_report` — in a single investigation without user intervention.

Alternative architectures (RAG, fine-tuning) would require retraining as APIs change. MCP is pluggable, versioned, and swappable — add a new intel source in one file, no model retraining needed.

VALUE PROPOSITION

Without SOC Copilot	With SOC Copilot
2–4 hrs per investigation	< 60 seconds
5–7 browser tabs open	1 chat interface
Manual MITRE mapping	Automatic + verified
YARA rules: senior skill	Generated from hash
IR report: 45 min writing	Draft in 1 prompt

WHO PAYS AND WHY?

Primary buyer: MSSP firms. They serve dozens of enterprise clients — a tool that cuts analyst time by 80% lets them handle 5× the client load with the same headcount. At \$400/seat/month, a 20-analyst MSSP saves \$160K/year in labor while growing revenue.

Secondary buyer: Enterprise CISO. A 10-analyst SOC saving 2hrs/day = 20 analyst-hours recaptured daily. At \$50/hr fully-loaded cost, that is \$1,000/day in recovered productivity. ROI positive in week one.

INDUSTRY DISRUPTION POTENTIAL

Tier-1 SOC analyst roles (\$50–70K/year, highly repetitive) are the most directly automatable by this system. Gartner estimates 40% of Tier-1 alert triage will be AI-handled by 2026.

The broader disruption extends to the \$4B threat intelligence platform market (Recorded Future, Mandiant, CrowdStrike Falcon). These platforms sell static dashboards; SOC Copilot provides an interactive, reasoning agent that can explain, correlate, and act — not just display data.
